META7™ Solutions for the Red Stack

27 July, 2018

Unsafe Harbor

- This room is an unsafe harbor
- You can rely on the information in this presentation to help you protect your data, your databases, your organization, and your career
- No one from Oracle has previewed this presentation
- No one from Oracle knows what I'm going to say
- No one from Oracle has supplied any of my materials
- Everything I will present is existing, proven, functionality

Introduction

Daniel Morgan

🏆 Oracle ACE Director

■ Educator

🏛️ Wrote Oracle curriculum and primary program instructor at University of Washington

🏰 Oracle Consultant: Harvard University

■ University Guest Lecturers

- APAC: University of Canterbury (NZ)
- EMEA: University of Oslo (Norway)
- Latin America: Universidad Latina de Panama and Technologico de Costa Rica

■ IT Professional

- First computer: IBM 360/40 in 1969
- Oracle Database since 1988-9
- Beta Tester 10g, 11g, 12c, TimesTen, GoldenGate
- The Morgan behind www.morganslibrary.org
- Member Oracle Data Integration Solutions Partner Advisory Council
- Co-Founder International GoldenGate Oracle Users Group
- Principal Adviser: Sirius **Meta7**

System/370-145 system console

International Oracle Events 2016-2017 Calendar

Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

The Library

The library is a spam-free on-line resource with code demos for DBAs and Developers. If you would like to see new Oracle database functionality added to the library ... just email us. Oracle Database 12cR2 is now available in the Cloud. If you are not already working in a 12cR1 CDB database ... you are late to the party and you are losing your competitive edge.

3 Essential DBA Career Priorities For 2018

OracleVoice

Simplify IT, Drive Innovation [FULL BIO](#) ✓

Jeff Erickson, Oracle

Many database administrators (DBAs) will go into 2018 wondering if “self-driving” databases will weaken their career prospects. More likely, 2018 will be a year that database technology leaps forward and these valuable data experts take on other, more important responsibilities.

“History is repeating itself,” says longtime DBA Dan Morgan, founder of [Morgan’s Library](#) and principal adviser at tech firm Meta7. Morgan has seen the DBA role evolve amid a long series of technical advances in storage, management, and performance. And each advance asked DBAs to adjust the way they work.

Meta7 is a Division of Sirius

- Sirius acquired Forsythe Nov 1, 2017
- Combined we are a \$3.5B consultancy and VAR
- World's largest IBM integrator
- Second largest security integrator in North America
- Our focus areas
 - Silicon up through Data Integration
 - Stability
 - Security
 - Scalability

Business Case

- Load Distribution
 - The current server infrastructure is not sufficient to handle the demands placed upon it; for example it would save the organization both time and money if analytic queries were run against a separate database performance optimized for those queries
- Upgrading
 - The organization wishes to upgrade from one version of a product to a different version of the same product; for example 11.2.0.3 to 12.1.0.2 with near-zero downtime
- Homogeneous Migration
 - The organization wishes to migrate a database from one hardware platform to another; for example Oracle Database on Solaris to Oracle Database on Linux
- Heterogeneous Migration
 - The organization wishes to migrate from one database product to another; for example from stand-alone SQL Server to Oracle RAC on an ODA

- Data Distribution
 - The organization wishes to make data available at different physical locations without dependency upon the internet; for example the corporate head quarters are in London England but the manufacturing facilities are in Latin America
- Data Consolidation
 - The organization has multiple locations where data is collected and wishes to have a single source that combines them all for management reporting and analysis, for example there are 8,200 retail stores in North America, each with its own on-site database and the corporate headquarters needs to be able to run a single query across data from one region's stores or all stores in all regions
- Data Access Sharing
 - The organization wishes to have two separate locations with equal access to data with the ability to perform DML and DDL, for example the organization considers each office a DR site for the other

- Security
 - The organization stores both public and confidential information some of which it does not wish to make vulnerable by making it visible through-out the organization; for example data collection from an e-commerce site that processes both orders and credit cards
- Auditing
 - The organization wants a database of suspicious transactions for fraud investigators where the source might be multiple databases, from multiple vendors; for example the organization has both Oracle and DB2 databases and wants a single repository for internal auditors
- Data Transformation
 - The organization wants to load data from OLTP (On-Line Transaction Processing) systems into one or more data warehouses, Operational Data Stores (ODS) or Decision Support Systems (DSS); for example the data warehouse collects data from only specific tables and columns and must load them into cubes

What Is GoldenGate

Part of a Family of Data Integration Technologies

Other Oracle Database Replication Technologies

- Data Guard
 - Physical
 - Logical
 - Usable only when the source and the target are identical
 - Operating System and Database Version
- Streams
 - While still supported and used, Streams had a number of issues (which is why Oracle acquired GoldenGate) and is no longer Oracle's strategic replication product, it's on a continue and converge path and will continue to be supported but not extended to support multi-tenant container databases
- Change Data Capture (CDC)
 - A subset of Streams capabilities: Support will continue but capabilities will not be enhanced for multi-tenant container databases
- Materialized View, Database Links, 3rd Party Products

What Makes An Ideal Replication Solution?

- Replication apply time configurable from near-zero to a pre-set delay
- Scalable to handle high transaction volumes
- Minimal footprint and impact to existing systems
- Modular architecture supporting multiple data sources and targets
- Fault tolerant
- Maintains transactional integrity
- Reliable
- Secure
- Stable

What Is GoldenGate?

- A software tool that creates a tunnel between two, or more physically separate systems such that they can behave as a single logical system
- Middleware that provides a data communications channel between a source from which transactions will be read and a target to which the transactions will be written
- GoldenGate connections can be homogeneous, for example Oracle Database to Oracle Database, or heterogeneous, for example Teradata to Oracle Database
- Full support for data subsetting and filtering
- Full support for data transformation and enrichment support
- Full support for Data Manipulation Language (DML)
- Full support for Data Definition Language (DDL)
- Unlike Oracle Service Bus ... understands transactions

Logical Replication Architectures

Unidirectional
Reporting Instance

Bi-directional
Active:Active Failover

Peer-to-Peer
Load Balancing, High Availability

Broadcast
Data Distribution

Consolidation
Data Warehouse/Mart/Store

Cascading
Scaling, Database Tiering

Logical Architecture

GoldenGate Components

- Source & Source Processes
 - Manager
 - Monitors and manages running GoldenGate processes
 - Writes the alert log
 - Performs file maintenance
 - Extract
 - Pump
- Parameter Files
- Trails
 - also referred to as Extract Files, Trail Files, Local and Remote Trail Files
- Target & Target Processes
 - Manager
 - Collector
 - Replicat

Logical Flow (1:4)

Currently Supported Environments

Data and Transaction Sources	Data and Transaction Targets		Operating Systems
▪ Cassandra ▪ HP SQL/MP ▪ HP SQL/MX ▪ IBM DB2 (LUW) ▪ IBM DB2 (Z/OS) ▪ IBM DB2 for I (AS/400) ▪ IBM Informix ▪ JMS message queues ▪ Microsoft SQL Server ▪ Oracle Database ▪ Oracle MySQL ▪ Oracle TimesTen ▪ Sybase ASE ▪ Tandem ▪ Teradata	▪ Amazon S3 ▪ Big Data ▪ ALO Framework ▪ Apache Flume ▪ Apache Hadoop ▪ Apache HBase ▪ Apache Hive ▪ Apache Kafka ▪ Apache Spark ▪ Apache Storm ▪ AVRO ▪ Base24 (ATM & POS) ▪ HDFS ▪ JSON ▪ MongoDB ▪ Cassandra ▪ EMC Greenplum ▪ HP Enscribe ▪ HP SQL/MP ▪ HP SQL/MX	▪ IBM DB2 (LUW) ▪ IBM DB2 (Z/OS) ▪ IBM DB2 for I (AS/400) ▪ IBM Informix ▪ IBM Netezza ▪ IBM System I ▪ IBM System Z/OS ▪ JMS Message Queue ▪ Microsoft SQL Server ▪ ODBC Databases ▪ Oracle Database ▪ Oracle MySQL ▪ Oracle NoSQL ▪ Oracle TimesTen ▪ Sybase ASE ▪ Tandem ▪ Teradata ▪ Flat Files ▪ XML Files	▪ HPUX IA64 ▪ HP NonStop Itanium ▪ IBM AIX ▪ IBM z/OS ▪ IBM iSeries ▪ Linux x86-64 ▪ Oracle Solaris Sparc ▪ Oracle Solaris x86-64 ▪ Windows x86-64 ▪ z/Linux (IBM mainframe) ▪ Cloud environments ▪ AWS ▪ Azure ▪ Google ▪ IBM ▪ Oracle ▪ SAP

The Extract process captures transactions and writes them to a Local Trail File

The Pump process routes and copies the trail file from the Local directory to the Remote location(s)

The Replicat process reads the Remote Trail File and Applies transactions

Complete Logical Flow with Managers

The Pump process communicates with the Target's Manager and requests a Collector process to transfer the trail file

Logical Flow: Bi-directional

Physical Architecture and Installation

Configuration

GoldenGate Configuration

- Configuration is performed using parameter files very similar in concept and editing to the database initSID.ora
- GG parameter files are ASCII text ... they are not compiled
- The major parameter files are:
 - GLOBALS
 - manager (mgr.prm)
 - extract
 - pump
 - replicat
- Some of the more important minor parameter files are
 - CMDSEC (command security)
 - ENCKEYS (encryption keys)
 - TCPERRS (Posix-based TCP/IP network error handling)
 - The Collector process does not have an editable parameter file

GLOBALS Parameter File

```
-----  
-- Sample GLOBALS File - Author: Daniel Morgan Date: 14-JUN-2018  
-----  
CredentialStore /home/oracle/ggcredentials  
AllowInvisibleIndexKeys  
CharSet UTF-8  
GGSchema ggadmin  
MaxGroups 256  
OutputFileUMask 022  
Syslog ALL
```

Manager Parameter File

```

Database Preparation

Database Preparation Steps

- GoldenGate Home Directory
- Archivelog Mode
- Force Logging
- Supplemental Logging
- GG Admin Schema
- Roles and System Privileges

GoldenGate Home Directory

- A separate GoldenGate instance must be created for every Oracle instance on a server, or in a VM, you wish to replicate
- One GoldenGate instance connects to only one Oracle Database instance
- Create a directory under ORACLE_BASE/product to hold the GoldenGate application files
- If one ORACLE_BASE services multiple Oracle homes then perform multiple GG installs and be sure you name the directories so that you know which directory corresponds with which Oracle home
- A GoldenGate installation requires less than 250MB of disk
- The trail files can consume substantial space and should be on a separate mount point(s) with very fast disk

Archive Log Mode and Force Logging

- Simply put ... transactions that do not get written into the redo logs do not get replicated
- A danger to data integrity is any object created or modified using NOLOGGING

```
SQL> conn / as sysdba

SQL> SHUTDOWN IMMEDIATE;

SQL> STARTUP NOMOUNT;

SQL> ALTER DATABASE ARCHIVELOG MODE;

SQL> ALTER DATABASE MOUNT;

SQL> ALTER DATABASE FORCE LOGGING;

SQL> ALTER DATABASE OPEN;
```

Supplemental Logging

- Supplemental logging is essential for the following situations
 - Tables without primary keys
 - Tables without unique constraints
 - Tables without unique indexes
 - Transactions that may alter one or more rows but the SQL does not alter the columns corresponding to the unique identifier or use it to define the columns to be updated

```
SQL> conn / as sysdba
```

```
SQL> ALTER DATABASE ADD SUPPLEMENTAL LOG DATA;
```

```
SQL> ALTER SYSTEM SWITCH LOGFILE;
```

- The GoldenGate administrator will issue commands from within GoldenGate using the syntax SCHEMATRANDATA or TRANDATA that will enhance supplemental logging

GoldenGate Administration Schema

- On the both source and target databases a GoldenGate administration schema must be created
- The most common name for this schema is GGADMIN
- The Oracle docs recommend giving the admin user privileges far in excess of what is actually required
 - If operational security is important to you do not follow Oracle's recommendations
 - For example Oracle recommends giving the GG administrator the privilege of flashing back the database
 - Giving anyone other than a senior DBA the flashback database privilege is **totally irresponsible** (and you can tell Oracle I said so)

Database Roles and System Privileges (1:3)

- GoldenGate capabilities, as of GoldenGate version 12.1 are integrated into the database and require the following

```
SQL> conn / as sysdba

SQL> ALTER SYSTEM SET enable_goldengate_replication=TRUE SID=* SCOPE=spfile;
-- restart the database

-- on the source only
SQL> exec dbms_goldengate_auth.grant_admin_privilege('GGADMIN', 'CAPTURE', TRUE);

-- on the target only
SQL> exec dbms_goldengate_auth.grant_admin_privilege('GGADMIN', 'APPLY', TRUE);

-- if Transparent Data Encryption is in use in database version 12.1 or above
SQL> GRANT execute ON dbms_internal_clkm TO ggadmin;
```

- Some versions of GoldenGate with an Oracle Database may require running scripts that create tables, sequences, triggers, and roles that are granted to the GoldenGate administrator schema

Container Databases Notes

```
-- the GG admin user must be a common user
SQL> exec dbms_goldengate_auth.grant_admin_privilege('C##GGATE', '*', TRUE, CONTAINER=>'ALL');
```

- Source System Privileges
 - CREATE SESSION
 - CREATE TABLE
 - SELECT ANY DICTIONARY
 - SELECT ANY TABLE
 - SELECT ANY TRANSACTION

- Target System Privileges
 - CREATE SESSION
 - CREATE TABLE
 - SELECT ANY DICTIONARY
 - INSERT ANY TABLE (if DML inserts will be replicated)
 - UPDATE ANY TABLE (if DML updates will be replicated)
 - DELETE ANY TABLE (if DML deletes will be replicated)
 - ALTER ANY <object_type> (for DDL replication is enabled)
 - CREATE ANY <object_type> (if DDL replication is enabled)
 - DROP ANY <object_type> (if DDL replication is enabled)

Subsetting & Mapping

Subsetting

- Subsetting consists of starting with a full data set, the primary host server database and replicating a selected set of qualified transactions
- For example the subset might consist of
 - Only insert and update statements: Not deletes
 - Only invoice data (header and detail) but not look-up tables
 - Only columns that do not contain PII (Personally Identifiable Information)
 - Only rows that are modified by a person whose title is District Manager or Assistant District Manager

@RANGE Filtering

- You can use the @RANGE function in the filter clause to divide the processing workload among multiple processes, using separate MAP statements, to improve performance

- Syntax:

```
@RANGE (range, total_ranges [, column] [, column]  
[, ...])
```

- For example, the following splits the replication workload into two ranges (between two Replicat processes or two threads of a coordinated Replicat) based on the ID column of the source EMPLOYEES table

- One Replicat parameter file will include the first MAP statement

```
MAP hr.employee, TARGET emp.staff, FILTER (@RANGE (1, 2, PID));
```

- Second Replicat parameter file will include the second MAP statement

```
MAP hr.employee, TARGET emp.staff, FILTER (@RANGE (2, 2, PID));
```

WHERE Clause Filtering (1:2)

- The syntax for **WHERE** is identical in the **TABLE** and **MAP** statements
- Each **WHERE** clause must be enclosed within parentheses
- Literals must be enclosed within single quotes
- Permissible **WHERE** operators
 - Column names (*i.e.* LAST_NAME, SALARY, ID)
 - Numeric values (*i.e.* 4096, -545, 3187.775)
 - Literal strings (*i.e.* 'FL', 'Fred', 'Auto')
 - Built-in column tests (*i.e.* @NULL, @PRESENT, @ABSENT)
 - Boolean Comparison operators (*i.e.* =, <>, >, <, >=, <=)
 - Conjunctive operators (*i.e.* **AND**, **OR**)
 - Use parentheses for logical grouping of multiple elements

WHERE Clause Filtering (2:2)

- TABLE Syntax

`TABLE <table_name>, WHERE (<where_clause>);`

- TABLE Example

```
TABLE hr.employee, WHERE first_name = @PRESENT;  
TABLE hr.employee, WHERE (employee_id < 100);
```

- MAP Syntax

`MAP <source_table>, TARGET <target_table>, WHERE (<where_clause>);`

- MAP example

```
MAP hr.employee, TARGET hr.employee_data,  
WHERE salary > 50000 AND active_flag = 'Y';
```

Schema, Table, and Column Mapping

- COLMAP - Table-level Column Mapping
 - Valid for both TABLE and MAP
 - Map individual source columns to target columns that have different names
 - Specify default column mapping when an explicit column mapping is not needed
 - Provide instructions for selecting, mapping, translating, and moving data from a source column into a target column
 - Syntax
`COLMAP ([USEDEFAULTS,]
target_column = source_expression)`
 - Examples

```
MAP sh.sales, TARGET sh.sales, COLMAP (UseDefaults);
```

```
MAP sh.sales, TARGET sh.sales_remap, COLMAP (prod_id = prod#, amount_sold = invoiced_quantity);
```

Data Transformation & Enrichment

Data Transformation

- Basic Transforms

- A commonly seen transformation is converting <first_name><space><last_name> into the equivalent <last_name><comma><space><first_name> for example "Daniel Morgan" becomes "Morgan, Daniel"

- Data Masking Transforms

- Also referred to as "Data Masking"
- A technology that transforms most often sensitive information by changing its form
- A commonly seen example of a data masking transform is converting a social security number (678-91-2345) into a masked (****-**-2345)

```
MAP hr.employee, TARGET hr.staff, COLMAP (USEDEFAULTS,  
wages = @COMPUTE(salary * 12),  
full_name = @STRCAT(last_name, ", ", first_name));
```

Data Enrichment

- Data enrichment is the process by which GoldenGate can be used to add new columns to the data stream using either
 - Default values
 - Dynamic values

```
MAP hr.employee, TARGET hr.staff, COLMAP (USEDEFAULTS,  
wages = @COMPUTE(salary * 12),  
full_name = @STRCAT(last_name, ", ", first_name),  
source_system_id = 'EBS',  
target_commit_timestamp = SYSDATE);
```

Troubleshooting and Debugging

DBA Considerations

- The most common problems are network stability issues
- The second most common problems are caused by DBAs and Developers making schema changes that create collisions
 - For example inserting rows into the target that will later cause a failure when an identical key is replicated from the source
- The third most common issues relate to adding and altering tables creating supplemental logging failures
- Help your GoldenGate admin identify processing -intensive tables so they can be replicated using separate processes
- There are special considerations for ASM and RAC dependent upon GoldenGate and Database version ... do your research
- Bidirectional replication is hard ... not because of the database and not because of GoldenGate but because of application designs not capable of supporting it

Security

Credential Store

- Deploy GoldenGate version 12.1 with a Credential Store to hold login userid and passwords to protect the database

```
[oracle@gg00a gghome_1]$ cd dircrd
[oracle@gg00a dircrd]$ ggsci

Oracle GoldenGate Command Interpreter for Oracle
Version 12.1.2.1.0 OGGCORE_12.1.2.1.0_PLATFORMS_140727.2135.1_FBO
Linux, x64, 64bit (optimized), Oracle 11g on Aug  7 2014 09:14:25
Operating system character set identified as UTF-8.

Copyright (C) 1995, 2014, Oracle and/or its affiliates. All rights reserved.

GGSCI (gg00a) 1> ADD CREDENTIALSTORE

Credential store created in ./dircrd/.

GGSCI (gg00a) 1> exit

[oracle@gg00a dircrd]$ ls -l
total 4
-rw-r----- 1 oracle oinstall 324 May  9 12:06 cwallet.sso

GGSCI (gg00a) 1> ALTER CREDENTIALSTORE ADD USER ggadmin PASSWORD ora123 ALIAS ggadm

Credential store in ./dircrd/ altered.

GGSCI (gg00a) 1> dblogin useridalias ggadm
Successfully logged into database.
```

Zero Downtime Migration

- The problem with most database migration attempts is that they require an outage
 - RMAN backup
 - A backup is taken and must be restored
 - Transactions during the time after the backup completes and before the new database is instantiated are not in the new database
 - This forces an outage as the database has no way to identify all transactions not included in the backup
 - Physical Data Guard
 - No matter the technology something must capture transactions while the standby is being built
 - If that "something" is the archived redo logs they require the database be in recovery mode while they are applied
 - Then the standby must be closed and opened as a read-write database

- With GoldenGate the technique is straight forward
 - GoldenGate capture is enabled as of a System Change Number prior to beginning either an RMAN backup or a DataPump export
 - The backup or export is used to create the new database
 - Delivery using the GoldenGate Replicat process, is started as of the SCN one higher than the last SCN captured by the backup or export
 - When the Replicat has caught up so that the backlog is less than 2 seconds all new transactions are directed to the new database
 - When the final transaction from the old database has been replicated, 1 to 2 seconds later, the old database can be shutdown
 - End users, and client applications, experience zero downtime
- ZDT Issues with GoldenGate
 - Some non-scalar data types

Wrap-Up

Conclusion

- In our opinion GoldenGate is
- The best homogeneous and heterogeneous replication tool on the market
- Robust capabilities for data enrichment, transformation
- Substantial toolset for troubleshooting and debugging
- Very small cpu, memory, and storage footprint
- Substantial capabilities for performance tuning
- Robust capabilities for subsetting and filtering
- Capable of solid security lockdown
- Easy to upgrade
- Easy to patch
- Secure
- Stable
- And the only tool that enables both homogeneous and heterogeneous zero downtime database migrations

Conclusion

- In our opinion GoldenGate is
- The best homogeneous and heterogeneous replication tool on the market
- Robust capabilities for data enrichment, transformation
- Substantial toolset for troubleshooting and debugging
- Very small cpu, memory, and storage footprint
- Substantial capabilities for performance tuning
- Robust capabilities for subsetting and filtering
- * Capable of solid security lockdown
- Easy to upgrade
- Easy to patch
- Secure
- Stable
- And the only tool that enables both homogeneous and heterogeneous zero downtime database migrations
