**The Library**

The library is a spam-free on-line resource with code demos for DBAs and Developers. If you would like to see new Oracle database functionality added to the library ... just email us. Oracle 12.1.0.2.0 has been released and new features will be showing up for many weeks. The first updates have already been made.

# IGGOUG: The New Users Group In The Neighborhood

The screenshot shows a web browser displaying the homepage of the International GoldenGate Oracle Users Group (IGGOUG). The URL in the address bar is [www.iggoug.org](http://www.iggoug.org). The page features a red header bar with the text "International GoldenGate Oracle Users Group". The main content area has a dark background with a city skyline at night. On the left, there's a sidebar with sections for "Oracle GG Documentation" (listing versions 12c, 11.2.1, 11.1.1, 11.1.1, and 10.4 of GoldenGate, along with a link to Oracle Database), "Blogs & Links" (describing it as focusing on GoldenGate), and "SOS: Support Our Sponsors" (thank you message to sponsors). The central column contains a welcome message, a link to the editor's page, a section for community members, a link for sharing content, and a table of supported databases (Oracle, Sybase ASE, DB2, Teradata, SQL Server, and more). The right side features sections for the "2014 Organizational Meeting" (mentioning OpenWorld), "Training Programs" (describing independent hands-on classes for Oracle, SQL Server, and DB2), "Oracle ACE Programs" (link to find an ACE), and the "Leadership Team" (mentioning their dedication to the user community). At the bottom, there are links for "Contact", "Members", and "Terms of Use".

[www.iggoug.org](http://www.iggoug.org)

# IGGOUG 2015 Conference

## Membership Qualifications

To become a member of the International GoldenGate OUG, you must meet one or more of the following qualifications.

1. You have an interest in Oracle's GoldenGate software
2. You have an interest in database replication
3. You have an interest in database platform migration
4. You have an interest in database version migration
5. You have been asked to be a presenter at an IGGUG event
6. You are willing to buy the first round for everyone else that does meet one or more of the above qualifications

**Want to be fully hardware, software, complete?  
Join us at our 2015 conference**

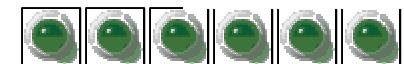

we will fly from San Francisco, over the bridge, on our way to:  
**Bora Bora, Tahiti: 28 October - 1 November, 2015**  
the conference will include time for a "personal software" refresh

[Contact](#) [Home](#) [Terms of Use](#)

# First Principles

---

- If the database is unavailable it is a database problem
- If the database is slow it is a database problem
- Oracle DBAs are expected to find database problems
- To fix the database so the problem never happens again
- To write an RCA (Root Cause Analysis) document
- Which will point to the database
- Even when the database isn't the root cause
- Because that is what DBAs are trained to do
- Did I mention ... the network is just fine?

# My Blog: January 10, 2011

---

If databases were run with the same degree of intelligence and attentiveness as a network router we would:

log in as SYS, type

**SELECT \* FROM dual;**

and if we did not get an exception, declare everything was fine.

[network admins]..., I might be inclined to recommend that we plug a couple of them into their own networks and see if they light up.

# What Is Root Cause Analysis?

---

- Root Cause Analysis is finding, fixing, and reporting on, the event that precipitated a service related incident
- The incident or change may have resulted in one or more failures that affected database performance and/or availability
- Sometimes the root cause is within the database, for example a bug, it is at least equally probable the database was an innocent bystander

- The point is to avoid repeated fire fighting exercises

## Root-Cause Analysis - PROVISIONAL

**Node 5 Eviction 2010-12-06 18:32**

**Author:** Daniel Morgan

**Date:** 8 Dec 2010

**Version:** v 1.0

**Status:** Provisional

**Reference:** RCA-PROV\_201012061832\_Node5

# Root Cause Analysis Doc (3:7)

## 1 Introduction

### 1.1 Scope

This document is a root-cause analysis for the OPM01P database event that started at on Monday Dec 06 at 18:32:12 2010 on instance opm01p5. It is current a PROVISIONAL assessment and subject to change

### 1.2 Revision History

Revision Number	Date	Name	Revision
1.0a	8 Dec 2010	Daniel Morgan	Initial Version of Document

### 1.3 Review/Approval

Reviewer	Date	Feedback
S Bowke	8 Dec 2010	Approved for release as a PROVISIONAL root-cause assessment for discussion purposes

### 1.4 Outstanding Actions List

This section is to be used to capture the outstanding actions

Outstanding Actions List					
Action No	Priority	Owner	Description	Date Raised	Status
1	1	Daniel Morgan	Issue Full RCA	8 Dec 2010	In-Progress

# Root Cause Analysis Doc (4:7)

## 2 RCA Timeline

At 6.32 Dec 6, Node opm01p5 alert log makes reference to the global resource directory, the global resource directory keeps details of how resources are used within a cluster database.

```
Mon Dec 06 18:32:12 2010
Reconfiguration started (oldinc 16, newinc 18)
List of nodes:
 4 5 6 7
Global Resources Directory frozen
Communication channels reestablished
Master broadcasted resource hash value bitmaps
Non-local Process blocks cleaned out
Mon Dec 06 18:32:21 2010
LMS 1: 33 GCS shadows cancelled, 1 closed, 0 Xw survived
Mon Dec 06 18:32:21 2010
Mon Dec 06 18:32:21 2010
LMS 0: 1 GCS shadows cancelled, 0 closed, 0 Xw survived
LMS 2: 2 GCS shadows cancelled, 0 closed, 0 Xw survived
Mon Dec 06 18:32:23 2010
  Set master node info
  Submitted all remote-enqueue requests
```

The LMON was unable to fix the issue and subsequently crashed at 6.37 (several related bugs apparent on metalink)

```
Mon Dec 06 18:37:12 2010
LMS2 (ospid: 13489) has not called a wait for sub 0 secs.
ERROR: GES receivers are not healthy.
ERROR: LMON (ospid: 13477) is terminating the instance.
ERROR: Please check LMON trace file for more detail
LMON (ospid: 13477): terminating the instance due to error 481
```

This in turn caused the instance to restart

```
USER (ospid: 9864): terminating the instance
Instance terminated by USER, pid= 9864
Mon Dec 06 18:37:47 2010
  Starting ORACLE instance (normal)
```

# Root Cause Analysis Doc (5:7)

The instance then was unable to open as the global resource directory started to relocate the Global objects (this can take several minutes / hours).

DBAs, Oracle and System Administrators worked on the outage. DBA restarted Node 5 several times throughout the night however each time it came up queries to the GV\$views were failing on the system.

At 7:30pm Dec 6 XXX Recommended a full Database bounce to restore the System

At 8:39 PM /var/adm/messages on usp9004a (opm01p5) had the following entry:  
Dec 6 20:39:51 usp9004a ip: [ID 448101 kern.error] nxge5: <unknown primitive> failed: DL\_UNSUPPORTED

At 05:24am Dec 7 a secondary problem occurred on the system as /appl/oracle on usp9004b (opm01p6) was allowed to be filled up with logs and trace files being collected on the system.

Full Database shutdown was executed at 6:50am server time on Dec 7<sup>th</sup>.

[REDACTED]\_REPORT and [REDACTED]\_REPORT\_PWRUSR services were up and available on node 5 at 6:51am (1 minute outage).

All Nodes restarted by 07:05am Dec 7<sup>th</sup>

All Loaders restarted at 07:07am Dec 7<sup>th</sup>

All Summaries restarted at 09:54am Dec 7<sup>th</sup>

## 3 Initial RCA Statement

With the current settings on the system Node 5 has the highest load in the system. When the resource manager was disabled there were periods when resource manager was off where the system was working at 95% CPU load. User queries were executing on the system with hints having a high degree of parallel requested. It is currently believed that high parallel query at the same time as a high sustained CPU load caused the initial problem leading to the node eviction.

The initial findings point to the fact that by turning off the RM and keeping the `parallel_max_server` fairly high at 300 per instance resulted in Oracle hanging after a period of time as there was an increase in parallel sessions which in turn consumed all available CPU and resulted in timeouts for important tasks like inter node communication or slow response to other nodes.

When the DBAs tried to bring back node 5, the Oracle Database tried to rebalance that again, and caused all the processes that access cluster information like GV\$ views to hang on "reliable message". This is believed to be a bug previously experienced on the system for Node 2 on 07-Mar-2010 (Bug 9453004: INVESTIGATE DB INSTANCE 2 AND NODE B REBOOT). The inability to rebalance the Database meant the system could not come up cleanly as a 4 node RAC environment which is why a Database Bounce was requested.

## 4 Conclusion/Next Steps

Await response from Oracle RCA (bug 103776604) following their analysis of trace files/dumps taken during outage.

Recommend that Oracle Bug 9453004 raised March 7 be fixed by Oracle and applied when available.

User parallel query hints should be reduced and if at all possible eliminated. The loads on some nodes are high and may mean that we are under resourced and require extra hardware. Even with Resource Manager in place this may result in sub-optimal query times for users.

Re-assess if PSU need to be applied more regularly to minimize exposure to Oracle Bugs.

It is recommended that if two DBAs are working on the system at the same time, that they are in full communications with each other.

Explore the following potential related bugs:

Bug 6148054 - RAC hang waiting for "reliable message" [ID 6148054.8]

Bug 6773260: ORA-00600 [KOKEGPINLOB1] ON SELECT FROM GV\$PX\_SESSION, GV\$SESSION AND GV\$SQLAREA

# Let's Examine Some Real-World Cases

---

- Case 1: The Puppet Master
- Case 2: Jobs and Human Nature
- Case 3: More Jobs and Human Nature
- Case 4: Port Exhaustion
- Case 5: Storage Storage Everywhere
- Case 6: UCS (Unimpressive Common Servers)
- Case 7: Cisco 5010 to 7010 Migration
- Case 8: RAC is RAC: Server Manager is not Optional

---

# Case 1: The Puppet Master

# The Outage Fingerprint

---

Two physically separate two-node RAC clusters. They do not share servers. They do not share storage. They do not share network any component of the cache fusion interconnect ... and yet ... in 7 minutes 7 seconds ... they both go down.

Is it a database problem?

```

# Log File Research

**To:** <system and storage admins>  
**Cc:** <management>  
**Subject:** Need Hardware Information

Here is the signature of the ASM failure in DC20 over the last two days. Two different databases on different blades:

```
*** 2013-08-09 11:49:20.023
NOTE: ASMB terminating
ORA-15064: communication failure with ASM instance
ORA-03113: end-of-file on communication channel
Process ID:
Session ID: 82 Serial number: 9
error 15064 detected in background process
ORA-15064: communication failure with ASM instance
ORA-03113: end-of-file on communication channel
Process ID:
Session ID: 82 Serial number: 9
kjzduptcctx: Notifying DIAG for crash event
----- Abridged Call Stack Trace -----
ksedsts() +461<-kjzdssdmp() +267<-kjzduptcctx() +232<-kjzdicrshnf() +53<-ksuitm() +1325<-
ksbrdp() +3344<-opirip() +623<-opidrv() +603<-sou2o() +103<-opimai_real() +266<-ssthrdmain() +252<-
main() +201<-__libc_start_main() +244<-_start() +36
----- End of Abridged Call Stack Trace -----

*** 2013-08-09 11:49:20.134
ASMB (ospid: 15341): terminating the instance due to error 15064
ksuitm: waiting up to [5] seconds before killing DIAG(15317)
```

Can you help me please with the following:

1. Are all database blades in the same or different chassis?
2. What is the storage solution? VSP, NetApp? What diagnostics can we pull?
3. What network infrastructure between the blades and the storage array? What diagnostics can we pull?

# O/S Log: Ruby on RAC?

```
Aug  8 13:04:22 orap1n1 ERROR:  While executing gem ... (Gem::RemoteFetcher::FetchError)

```

# The Puppet Master Conclusions

---

- Two physically distinct RAC clusters were brought down by the use of a totally inappropriate tool by people that did not understand the implications of what they were doing
- The DBA team was never informed that the activity was going to take place
- The DBA team had no access to the change logs
- The databases were innocent bystanders and there was nothing the DBA team could have done to prevent the outage
- IT management was at fault for the outage by creating a situation with
  - Inadequate communications
  - Inadequate training for non-DBAs

---

## Case 2: Jobs and Human Nature

# Repeating Issue: User Configured Loads

RAC Server Node 1																								
MMDD	00	01	02	03	04	05	06	07	08	09	10	11	12	13	14	15	16	17	18	19	20	21	22	23

0811	107	82	51	34	85	17	22	10	73	10	12	11	92	32	13	69	65	11	11	10	60	9	12	9
0812	149	121	26	15	70	16	24	11	95	34	15	18	34	67	21	21	87	11	13	9	77	9	14	9
0813	115	76	55	56	27	9	9	9	11	9	9	0	0	0	0	0	0	0	0	0	0	0	0	0

60 corresponds to one change per minute ... the ideal range is 4 to 12  
Addressed by resizing redo logs from 400MB to 4GB  
And rescheduling many of the jobs

# Jobs And Human Nature Conclusions

---

- DBAs must be able to control when and where jobs are scheduled based on run time and resource requirements
- Applications should NEVER be allowed to schedule multiple jobs to start at the exact same point-in-time
- Developers need to have partial ownership the problem
- None of this is likely to ever happen so DBAs need to play defense and monitor job scheduling by creating their own alerts
- IT management was at fault for the performance hits due to
  - Inadequate communications
  - Inadequate training for non-DBAs

---

## Case 3: More Jobs and Human Nature

# Unobserved Job Failure

```
SQL> SELECT owner, job_name, job_type, trunc(start_date) SDATE, trunc(next_run_date) NXTRUN, failure_count
  2  FROM dba_scheduler_jobs
  3* WHERE failure_count <> 0;
```

```

# Jobs And Human Nature Conclusions

---

- Sorry DBAs you don't get off blameless on this one
- As a DBA you **MUST** know what is happening on your system and you need to monitor more than just your email and the alert log
  - /var/log/messages
  - alert log
  - clusterware logs
  - ASM log
  - listener log
  - backup logs
  - job scheduling logs
  - AUD\$ and FGA\$
  - SQL\*Loader and External table loading logs
  - DataPump logs
  - And no you can not rely on OEM Cloud Control for most of this

---

## Case4: Port Exhaustion

**Hint: It is not caused by drinking too much port**

# In The Beginning (1:4)

---

- Customer Reports are stuck in the queue

Hi Ops

Report Jobs are getting stuck in Waiting in Queue. Also, having performance issues with Admin side

Thanks,

J

Step to Recreate

1. Log into Website
2. Navigate to Reports
3. Search for Account Data
4. Run the report for morgand
5. Notice that the report is stuck in Waiting in Queue

# In The Beginning (2:4)

---

- The website generated an HTTP403 error

As a partner we got communication that the previously assigned sandboxes will be brought down.

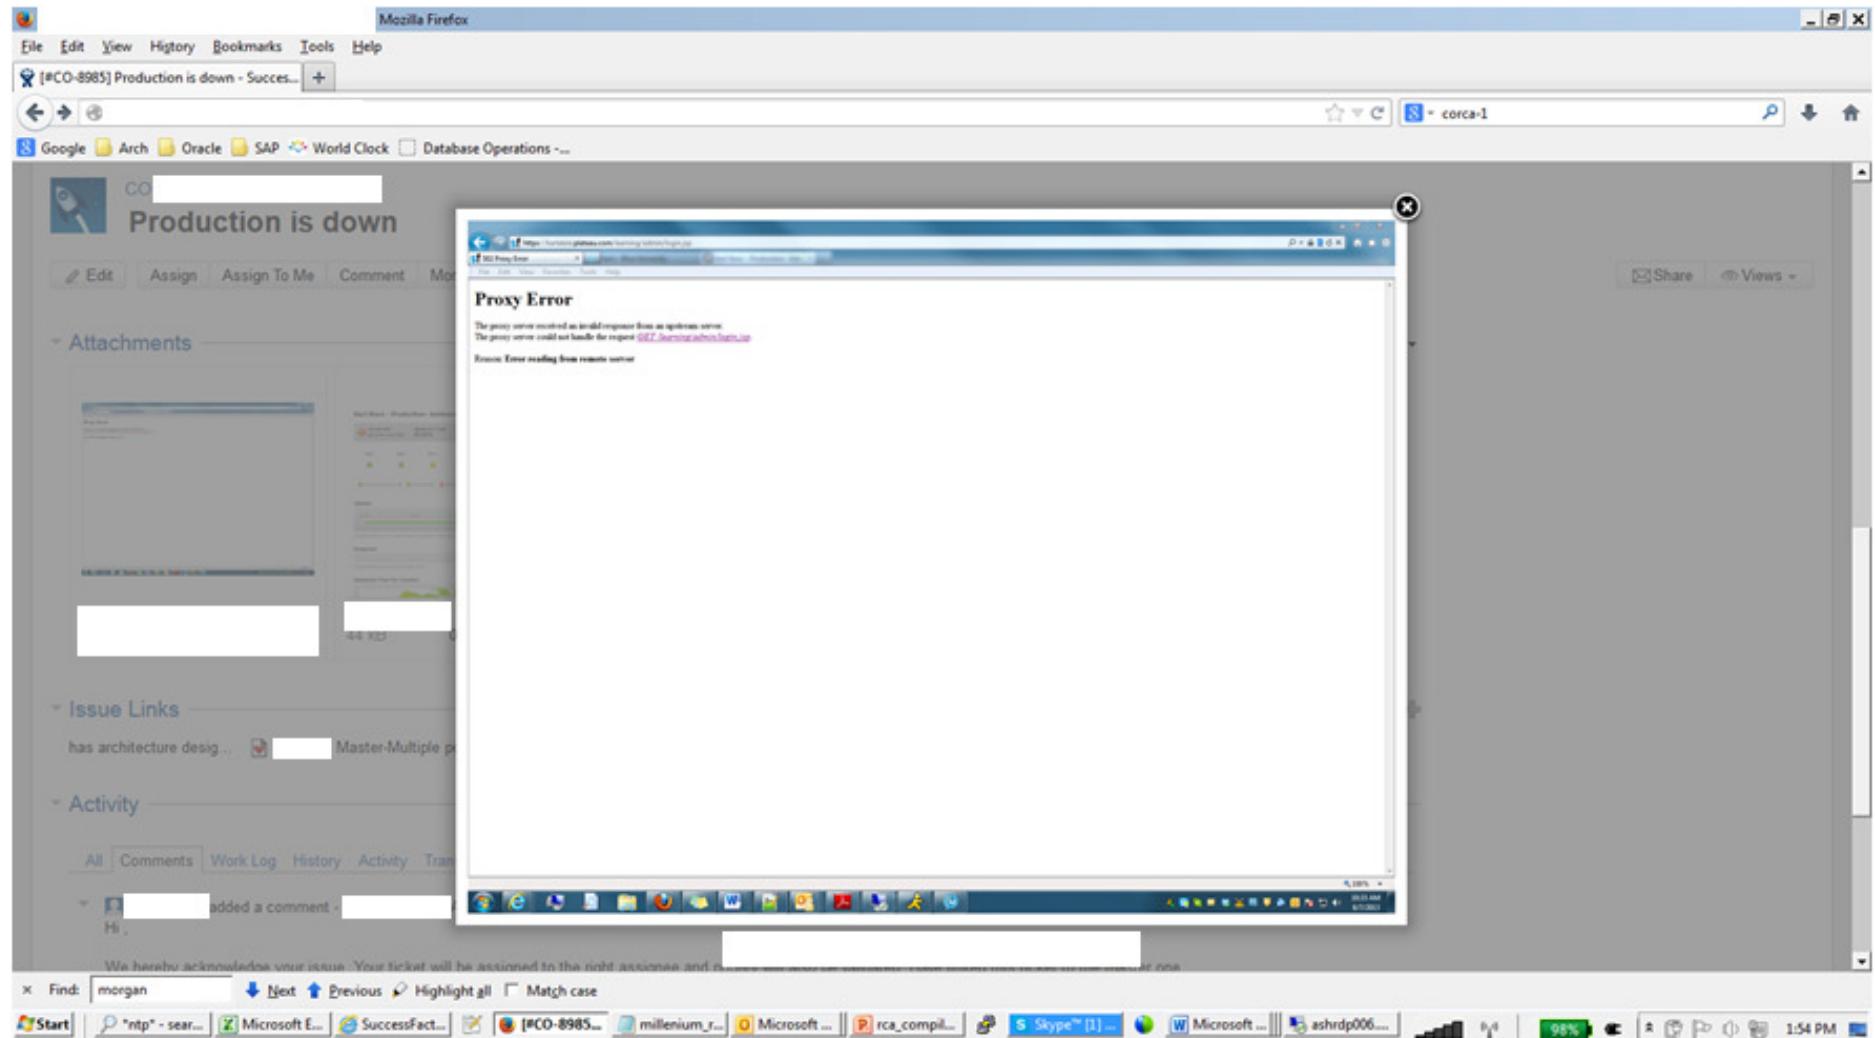

Instead -as a partner- we got a them demo environment assigned (Tenant ID: PARTNER0001 which we have integrated with a customer database instance (xxxdemo ace4morgan)).

Everything was working fine (including integration).

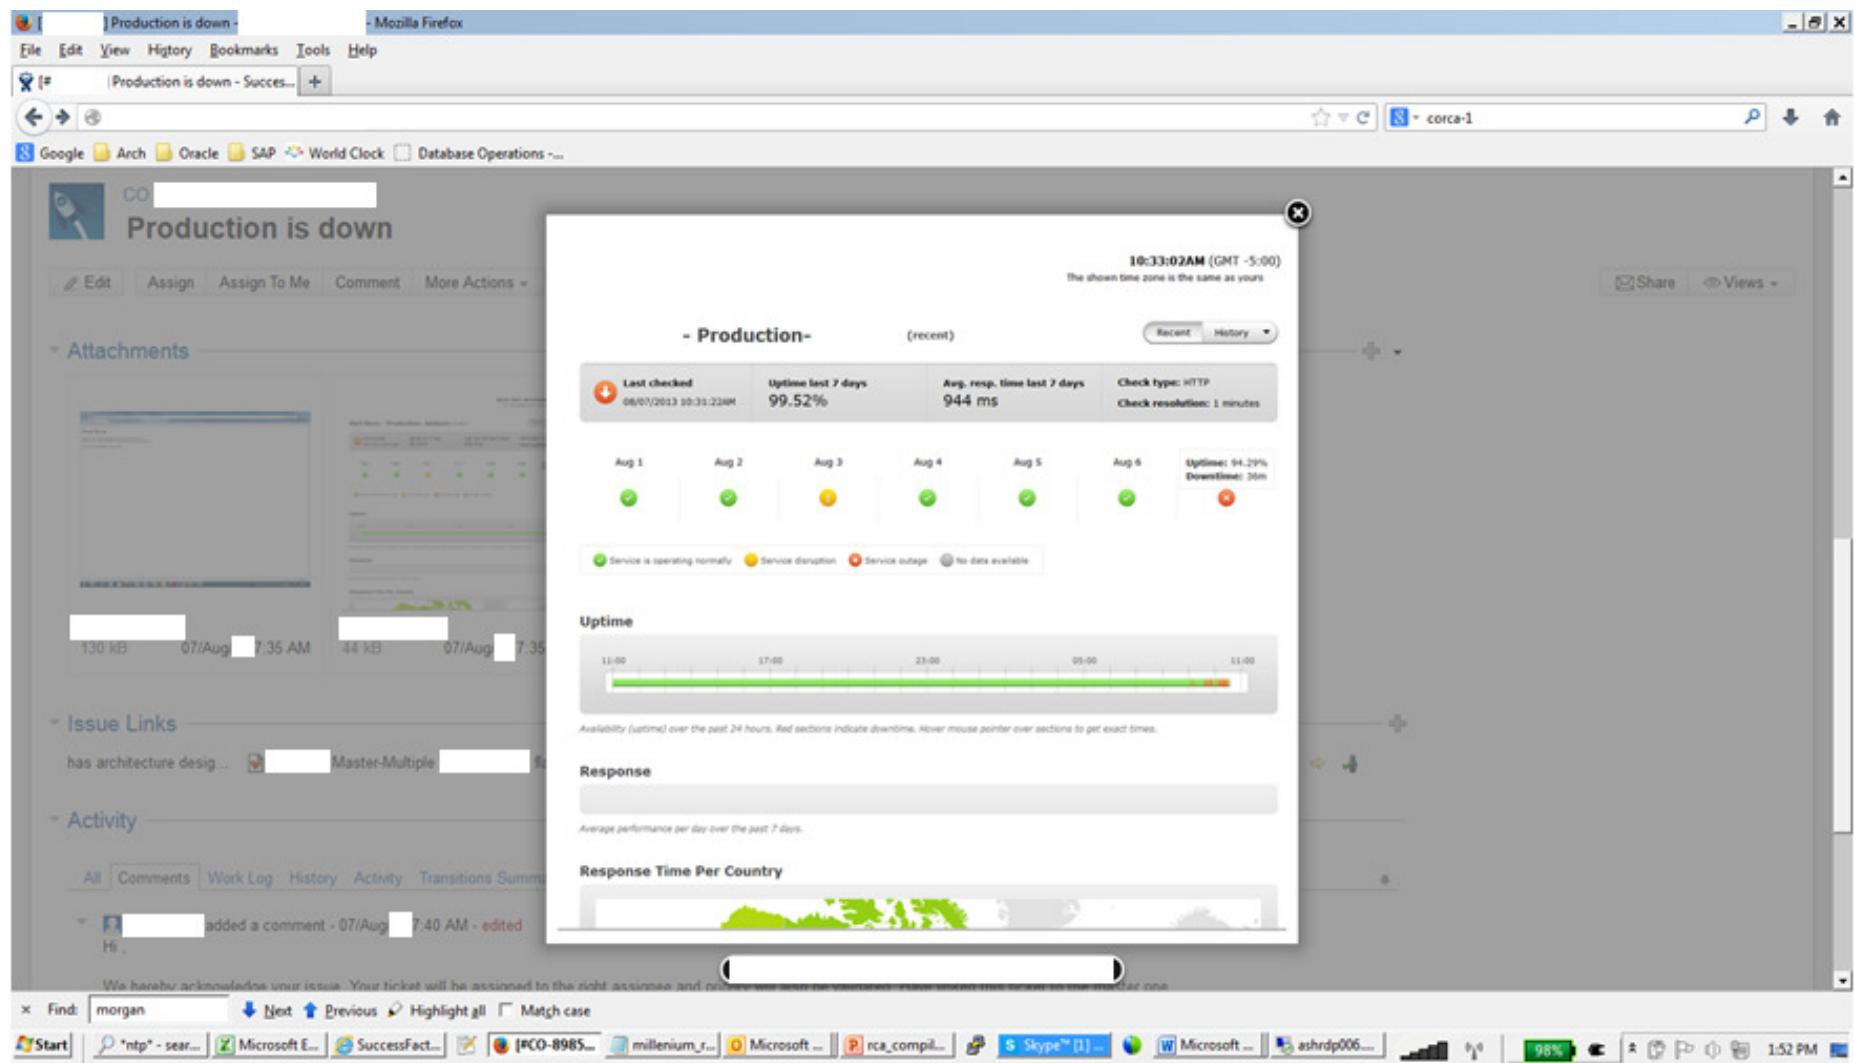

Today I tried to access the instance via the partner and via the direct url (<https://partner0001.demo.xxx.com/admin/nativelogin.jsp>) but in both case an error is displayed on the screen (see attachment).

We need this be fixed as soon as possible!  
(major customer demo session on Friday!)

# In The Beginning (3:4)

# In The Beginning (4:4)

# How Does An Application Server Connect to RAC?

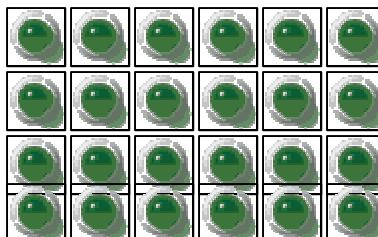

---

- Do you connect to the SCAN IP by name or number?
- If a name ... a DNS server resolves the name to an IP
- To avoid single points of failure you should have two or more DNS servers with a load balancer, or two, in front of them
- The SCAN IP points to a VIP which may again need to be resolved from a name to a physical IP address
- The VIP may again point to a name which must be resolved to a physical IP address
- Most servers cache DNS entries to improve speed
  - Do you know if yours do?

# Triaging a Connection Problem

---

- Try to connect to the cluster?
  - From where?
  - With what tool?
  - To the SCAN, VIP, or physical IP?
- Ping the IP addresses
- Run Trace Route on the IP addresses
- Read the listener log
- Read the database alert log
- Call the network admins who will tell you
  - everything looks good ...
  - the network is just Ok ...
  - the network is always Ok
  - the network will always be Ok

# RESOLVE.CONF (1:3)

---

## NAME

resolv.conf- resolver configuration file

## SYNOPSIS

/etc/resolv.conf

## DESCRIPTION

The `resolver` is a set of routines that provide access to the Internet Domain Name System. See [resolver\(3RESOLV\)](#). `resolv.conf` is a configuration file that contains the information that is read by the `resolver` routines the first time they are invoked by a process. The file is designed to be human readable and contains a list of keywords with values that provide various types of `resolver` information.

The `resolv.conf` file contains the following configuration directives:

### nameserver

Specifies the Internet address in dot-notation format of a name server that the resolver is to query. Up to `MAXNS` name servers may be listed, one per keyword. See [`<resolv.h>`](#). If there are multiple servers, the resolver library queries them in the order listed. If no name server entries are present, the resolver library queries the name server on the local machine. The resolver library follows the algorithm to try a name server until the query times out. It then tries the the name servers that follow, until each query times out. It repeats all the name servers until a maximum number of retries are made.

### domain

Specifies the local domain name. Most queries for names within this domain can use short names relative to the local domain. If no domain entry is present, the domain is determined from [sysinfo\(2\)](#) or from [gethostname\(3C\)](#). (Everything after the first `.' is presumed to be the domain name.) If the host name does not contain a domain part, the root domain is assumed. You can use the `LOCALDOMAIN` environment variable to override the domain name.

# RESOLVE.CONF (2:3)

---

## search

The search list for host name lookup. The search list is normally determined from the local domain name. By default, it contains only the local domain name. You can change the default behavior by listing the desired domain search path following the search keyword, with spaces or tabs separating the names. Most `resolver` queries will be attempted using each component of the search path in turn until a match is found. This process may be slow and will generate a lot of network traffic if the servers for the listed domains are not local. Queries will time out if no server is available for one of the domains.

The search list is currently limited to six domains and a total of 256 characters.

## sortlist *addresslist*

Allows addresses returned by the libresolv-internal `gethostbyname()` to be sorted. A `sortlist` is specified by IP address netmask pairs. The netmask is optional and defaults to the natural netmask of the net. The IP address and optional network pairs are separated by slashes. Up to 10 pairs may be specified. For example:

```
sortlist 130.155.160.0/255.255.240.0 130.155.0.0
```

# RESOLVE.CONF (3:3)

---

## options

Allows certain internal resolver variables to be modified. The syntax is

```
options option ...
```

where option is one of the following:

### debug

Sets `RES_DEBUG` in the `_res.options` field.

### ndots: *n*

Sets a threshold floor for the number of dots which must appear in a name given to `res_query()` before an initial absolute (as-is) query is performed. See `resolver(3RESOLV)`. The default value for *n* is 1, which means that if there are any dots in a name, the name is tried first as an absolute name before any search list elements are appended to it.

### timeout: *n*

### retrans: *n*

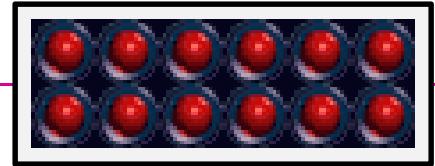

Sets the amount of time the resolver will wait for a response from a remote name server before retrying the query by means of a different name server. Measured in seconds, the default is `RES_TIMEOUT`. See `<resolv.h>`. The `timeout` and `retrans` values are the starting point for an exponential back off procedure where the `timeout` is doubled for every retransmit attempt.

### attempts: *n*

### retry: *n*

Sets the number of times the resolver will send a query to its name servers before giving up and returning an error to the calling application. The default is `RES_DFLRETRY`. See `<resolv.h>`.

# Resolution: The DNS Admin POV

On August 7th, we experienced a 2 hour outage that impacted more than 150 customers. In researching this outage it was noticed that DNS caching had been disabled on the Oracle Database Servers. Also, in going through the logs on the F5 Local Traffic Manager (LTM), it was noticed that there were 39,696 port exhaustion errors on port 53 going to the three DNS servers, starting at approximately 4am and ending slightly after 3pm. There were also an additional 625,665 port exhaustion error messages that were dropped in the logs, bringing the total to 665,361 port exhaustion error messages.

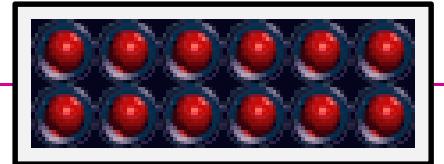

Further research discovered that there was a misconfiguration in the resolv.conf file on the servers in the data center. The resolv.conf file on these servers looked like this:

```
search morgan.priv
nameserver 10.24.244.200 (VIP pointing to servers listed below)
nameserver 10.24.244.21 (Bind server 01)
nameserver 10.24.244.25 (Bind server 02)
nameserver 10.24.244.29 (Bind server 03)
```

This results in the first DNS query going to the VIP for hostname and reverse IP resolution, and then to the three DNS servers. However, the 3 DNS servers which were supposed to be the alternative option to the VIP are also pointing to the same VIP. This basically sets up an infinite loop until the DNS queries time out.

The recommended resolution was to remove the VIP and have the servers query the DNS servers directly.

# Resolution: The DNS Admin POV

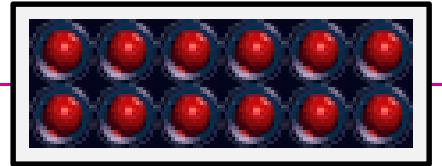

These graphs give an overview of what was happening throughout August 7th on the servers. I noticed that there is a sudden drop in connections right around 10:40am; and returning at around 10:45 am.

If you look at the files I've sent out previously, there is actually less evidence of port exhaustion between 10:22 and 10:42; with increasing levels of port exhaustion as connections and activity increases after about 12:07pm.

Additionally, I went back over the last few days and looked for port exhaustion for the DNS servers on port 53 and found the following:

Jul 29	-	16	port exhaustion errors
Jul 30	-	7	port exhaustion errors
Jul 31	-	8	port exhaustion errors
Aug 1	-	6	port exhaustion errors
Aug 2	-	38,711	port exhaustion errors
Aug 3	-	26,023	port exhaustion errors
Aug 4	-	22,614	port exhaustion errors
Aug 5	-	20	port exhaustion errors
Aug 6	-	11,282	port exhaustion errors

# Resolution: The DNS Admin POV

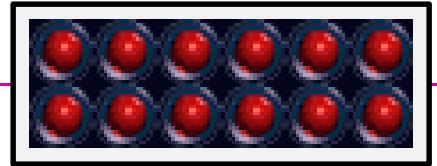

Additionally, I did some calculations on the additional port exhaustion log messages that were dropped – these were the throttling error that I mentioned previously.

On the 7th of August there were an additional 625,665 port exhaustion error messages that were dropped. On August 3rd, there were an additional 99,199 port exhaustion error messages that were dropped.

And on August 2nd, there were an additional 204,315 port exhaustion error messages that were dropped.

These numbers are in addition to the numbers of port exhaustion errors previously reported.

# Resolution: The System Admin POV

Every unix box at the LAX data center has this resolv.conf file:

```
search morgan.priv
nameserver 10.24.244.200 (VIP pointing to both AD01 and AD02 windows servers)
nameserver 10.24.244.21  (Bind server 01)
nameserver 10.24.244.25  (Bind server 02)
nameserver 10.24.244.29  (Bind server 03)
```

The idea behind this design is to firstly query the VIP (for hostname resolution) and then, the 3 bind servers which are slave DNS servers of the AD DNS servers described above.

Now, I've found that the BIND servers (unix) which are supposed to be the alternative option to the VIP, have the same /etc/resolv.conf file and therefore are also pointing to the VIP on the first place. As you can imagine this basically ends up in an infinite loop until the load balancer get finally some relief or the DNS queries timeout.

Refer to the attachment "Morgan current arch" to see the workflow.

The fix should be easy and basically would consist of removing the VIP from the /etc/resolv.conf from the Bind servers and have them pointing to each AD server (bind01 -> AD01, bind02 -> AD02, etc).

The ultimate solution would be to remove the VIP from all the /etc/resolv.conf files and query the BIND servers (Helen has been asking for this for months) and although we have done that in the DEN environment, apparently that hasn't been done on the LAX side yet.

# Port Exhaustion Conclusions

---

- As a DBA you MUST understand how DNS is configured for every one of your databases
- As a DBA you MUST understand resolv.conf and monitor it for content and changes
- As a DBA you MUST educate DNS and System Admins about how to connect to a RAC cluster or a standby
- As a DBA, when troubleshooting connection issues, you MUST log in from an application server to identify what is actually going on ... you can't just FTP to the box

---

## Case 5: Storage Storage Everywhere

and not a byte to to fill

# Processing Stops and the NOC says

---

[Ticket] Commented: (1246816) mount points filled 100% on dc1laxdb01 and dc1laxdb03

Hi,

Two mounts got filled 100%, please add space as early as possible.

/u108 on dc1laxdb01

/export/home on dc1laxdb03

There are only datafiles in both mount points,

Thanks

Murphy

10 rows selected.

SQL> select sum(bytes)/1024/1024/1024 FREE_SPACE
  2  from dba_free_space
  3  where tablespace_name = 'LOB_01';

FREE_SPACE
-----
6166.08484
```

# How Much Free Space Is There Really?

---

- Hard disk not fully occupied by data files
- Data files not fully occupied by segments
- Segments with extents above the high water mark
- Partially filled blocks
- Full blocks with empty space due to the PCTFREE setting
- LOB tablespace space occupied by undo data

Vaccum	Wasted
Not allocated for data files	5.5T
Freespace in LOB Tablespace	6.2T
Space in used blocks	2.3T
Total	14T (more than 50% of the 27.3T allocated)

- And yet the database is "out of space"

# How Much Disk Space Really Isn't Real

---

- Disk space too small for another datafile
- Tablespaces with too little room for another extent
- Space that has been over-allocated due to storage virtualization

# Storage Usage Conclusions

---

- Bytes that spin cost
  - money to purchase them
  - money to provide electricity to spin them
  - money to provide air conditioning to cool them
  - money to pay for the floor space they occupy
- Wasting space is wasting money
- Advanced and Hybrid Columnar Compression will not address the issues created by poor planning and usage
- You probably don't need pct\_free set at 0%
- If you store BLOBs and CLOBs you need to know how much space is wasted storing undo
- Bigfile tablespaces are superior very often to Smallfiles
- There is almost no justification for lots of tablespaces and lots of datafiles: If you do it you must justify it

---

## Case 6: UCS

**and all the other blade servers we don't need and never asked for**

## But first ...

---

- Network stability is critical to Oracle DBAs
- If you have network issues you can waste staggering amounts of time proving the issue isn't the database
- I have worked for the last 10 months with Cisco UCS
  - ~10 databases stand-alone 11gR2
  - ~75 RAC Active-Active or Clusterware Active-Passive Failover
- The questions that need to be addressed are
  - What is the value of failover to a cluster?
  - What is the value of functioning network diagnostics?

# VLANs and the Cluster Interconnect (1:2)

- It is essentially impossible do what is recommended in Oracle Support's "best practices" guidelines for RAC with blades: any blades from any vendor

## RAC: Frequently Asked Questions (Doc ID 220970.1)

Cluster interconnect network separation can be satisfied either by using standalone, dedicated switches, which provide the highest degree of network isolation, or Virtual Local Area Networks defined on the Ethernet switch, which provide broadcast domain isolation between IP networks. VLANs are fully supported for Oracle Clusterware interconnect deployments. Partitioning the Ethernet switch with VLANs allows for:

- Sharing the same switch for private and public communication.
- Sharing the same switch for the private communication of more than one cluster.
- Sharing the same switch for private communication and shared storage access.

The following best practices should be followed:

The Cluster Interconnect VLAN must be on a non-routed IP subnet.

All Cluster Interconnect networks must be configured with non-routed IPs. The server-server communication should be single hop through the switch via the interconnect VLAN. There is no VLAN-VLAN communication.

Oracle recommends maintaining a 1:1 mapping of subnet to VLAN.

The most common VLAN deployments maintain a 1:1 mapping of subnet to VLAN. It is strongly recommended to avoid multi-subnet mapping to a single VLAN. Best practice recommends a single access VLAN port configured on the switch for the cluster interconnect VLAN. The server side network interface should have access to a single VLAN.

# VLANs and the Cluster Interconnect (2:2)

---

- It is extremely difficult to troubleshoot interconnect issues with UCS as the tools for separating public, storage, and fusion interconnect packets do not exist

Troubleshooting gc block lost and Poor Network Performance in a RAC Environment (Doc ID 563566.1)

## 6. Interconnect LAN non-dedicated

Description: Shared public IP traffic and/or shared NAS IP traffic, configured on the interconnect LAN will result in degraded application performance, network congestion and, in extreme cases, global cache block loss.

Action: The interconnect/clusterware traffic should be on a dedicated LAN defined by a non-routed subnet. Interconnect traffic should be isolated to the adjacent switch(es), e.g. interconnect traffic should not extend beyond the access layer switch(es) to which the links are attached. The interconnect traffic should not be shared with public or NAS traffic. If Virtual LANs (VLANS) are used, the interconnect should be on a single, dedicated VLAN mapped to a dedicated, non-routed subnet, which is isolated from public or NAS traffic.

# My Experience

---

- Blade servers, of which Cisco UCS are just one example, do not have sufficient independent network paths to avoid the networking becoming a single point of failure
- It is good when the public interface has a "keep alive" enabled but this is a fatal flaw for the cluster interconnect
- When different types of packets, public, storage, and interconnect are mixed low-level diagnostics are difficult if not impossible
- When different types of packets, public, storage, and interconnect are mixed the latency of one is the latency of all
- Traffic from any one blade impacts all blades

# UCS Blade Server Conclusions

---

- Blade servers may be a good solution for application and web servers
- They may even be acceptable for stand-alone databases
- Blade servers are unsuitable when
  - High availability is the goal
  - RAC the technology for achieving it
  - Performance is critically important
  - You don't want to stay at work at night, on weekends, and holidays troubleshooting repeated unexplained failures

---

## Case 7: 5010 <> 7010

**Things can break even when nothing is broken**

# What You Can't See Matters

- 6 Node RAC Cluster ... each node is an Sun M9000
- Storage is 3 clustered EMC VMax arrays = 1.25PB
- Public is bonded and redundant 10gEth
- The initial fusion interconnect is a single Cisco 5010
- The new interconnect is two bonded Cisco 7010s

WORKLOAD REPOSITORY report for						
DB Name	DB Id	Instance	Inst num	Startup Time	Release	RAC
OPM01P	782247420	opm01p6	6	18-Aug-10 21:08	11.1.0.7.0	YES
Host Name Platform CPUs Cores Sockets Memory (GB)						
usp9004b	Solaris[tm] OE (64-bit)	128	64	16	503.16	
Snap Id Snap Time Sessions Cursors/Session						
Begin Snap:	7037	15-Sep-10 13:00:18	406		7.5	
End Snap:	7038	15-Sep-10 14:01:28	318		8.5	
Elapsed:		61.17 (mins)				
DB Time:		6,076.88 (mins)				

- What could possibly go wrong?

# The First Node Always Starts

---

- Shutdown the RAC Cluster
- Pull 10gEth from Cisco 5010 and plug into Cisco 7010
- Start any one node of the cluster
- No other node joins the cluster: the order doesn't matter
- Plug cables back into the 5010 and all is well
- Cisco engineers verify the 7010 is in perfect condition
- Repeat the above steps ... result is the same no matter which node is started first ... no other node can join the cluster
- Repeat numerous times with different start orders ... the result is always the same

# What Is Happening?

---

- The first node started registers itself with the voting disk and knows no other nodes have started
- The second node, no matter which one is second, registers with the voting disk, sees that another node is in the cluster and tries to communicate with it
- The brand new "perfect" Cisco 7010 rejects every packet sent and the failure to communicate causes the second node to shoot itself in the head
- The question is: Why?

# Cisco 5010 to 7010 Migration Conclusions

---

- Cisco introduced a new error checking algorithm in the 7010s when they were initially released
- The algorithm rejected every RAC cluster interconnect packet as corrupt
- A resend request was made and the resent packets also failed to arrive at their destination creating a storm
- It is possible for everything to be working perfectly and yet for the full, integrated, system to fail
- For once the network admins were correct that the network was not to blame ... and yet it was, as is so often the case, the source of the failure

---

## Case 8: RAC Is RAC

**Server Manager usage is not optional**

# Ticket 108 (1:2)

Swap:      31  0  31
```

# Ticket 108 (2:2)

---

## **Root Cause:**

A review of Oracle Binary in `oras1n1` revealed that Oracle Databases were started by user “oracle” and at that point of time the `ORACLE_HOME/bin/oracle` executable group was “oinstall”. The `ORACLE_HOME/bin/oracle` executable group was accidentally changed to “asmadmin”, due to a known Oracle bug. Due to this bug, cluster nodes originally started with Server Control must always be started with Server Control and, if started with SQL\*Plus, can produce the result observed.

## **Corrective Action:**

Need to change the group of executable “oracle” to “oinstall” for all the database homes, if they have been modified. The bug hit has been acknowledged by Oracle and, at least in theory, should be fixed in version 12cR1 and above. Further improvements will be tracked by CSI via a Corrective Measure (CM).

# Server Manager Is Not Optional Conclusions

---

- DBAs MUST have training to successfully navigate our increasingly complex set of tools
- You can not run RAC successfully without knowing more than just syntax
- Oracle created UNDO tablespaces because DBAs didn't understand rollback segments
- Oracle created SCAN IP addresses because DBAs didn't understand how to create and manage services
- Hardly any DBAs build ASM diskgroups with **ATTRIBUTE (HOT MIRRORHOT)**
- Most DataGuard failures I've seen have been the result of not using DataGuard broker
- Do not expect good things to happen if you start and stop RAC clusters with SQL\*Plus
